

Vectrex 3D Imager manual

-beta - please do not copy!-
2014

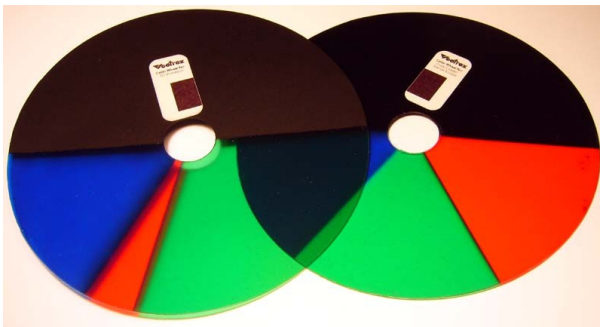

Hi,
here is some information helping you getting started with your 3D Imager.
First of all you might want to adjust the Imager to your head:

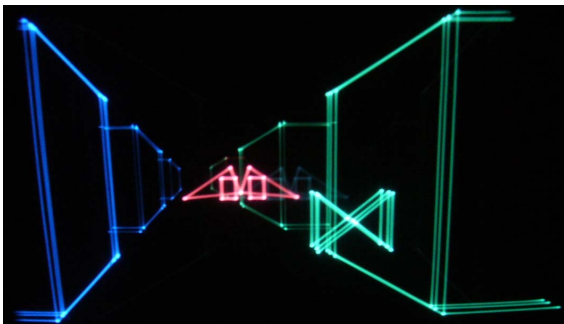

1: Adjust visor stiffnes to prevent visor from flipping down automatically. Don't tighten screws too strong.

2: Set head size. Best to be adjusted when wearing the Imager.

3: Set viewing height. Normally you won't need to adjust this one.

There were 2 color wheels and one small metal wheel with your Imager. Apply one color wheel with the white label facing towards the Vectrex.
Then put the metal wheel on top so that you can read the letters „TOP“

happy gaming!!!
